                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -:- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         *Characterization of single-nucleotide polymorphisms in coding regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE 99318693: Pubmed 1639;264;

Independent duplication of the growth hormone gene in three
Anthropoidean lineages.";
Submitted (ARR-2001) to the EMBL/GenBank/DDBJ databases.
I FUNCTION: Plays ac important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amnino acid uptake and protein synthesis in muscle and other issues (By similarity).
I Subschioliarity. Eccarious Secreted.

                                                                                             Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.

FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete [GF-1]. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscie and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caps

-!- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to slimulate the liver and other Lissues to secrete IGF-1. It stimulates both the differentiat.on and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other

-! FUNCTION: Plays an important role in growth control. Its major role in stimulating hody growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myobiasts. It also stimulates amino acid uptake and protein synthesis in muscle and other

This sequence represents a human insulin precursor comprising insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New chimeric proteins containing human growth hormone fragment, used particularly for the production of human insulin
                                                                                                                                    DNA encoding human insulin precursors - which comprise B- and A-chains linked via amino acid chain contq. 1 or more glycosylation sites, for prepn. of insulin in tungal cells
                                                                                                                                                                                                                                       DNA sequences encoding insulin precursors of formula 8-Pg A, where I and A represent B - and A-chains of insulin respectively, and Pg represents a modified or any number of amino acids comprising at least one qlycosylation consensus site, can be inserted into expression vectors which in turn can be used to transform the insulin expression vectors which in turn can be used to another included host cells. The fondal cells are then cultured and the insulin expressed in such cells cin be narvested.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Insulin; precursor; growth hormone; chaperone; intramolecular; folding; conformation; chimeric protein; clasavabie; recombinant;

The connecting peptide joines the Archain at the amino group of A-1 to the B-chain at the carboxyl group of B-30. The method is pref. for the propo. of human insulin precursor (see APAPA0829). The SOS of the connecting joptides of a number of species (Updated on 25-MAR-2003 to correct PA field.)

precursor can be a component of chimeric proteins which additionally contains an Verminal fragment of chimeric proteins which additionally contains an Neterinal fragment of chimeric proteins which additionally contains an Neterinal fragment of the portion of the chimeric protein acts as an intramolecular chapero. (IMC) for the insulin of protein acts as an intramolecular chapero. (IMC) for the insulin of protein acts as an intramolecular chapero. (IMC) for the insulin of protein acts as an intramolecular chapero. (IMC) for the insulin contains a C-lerminal Arg residue which enables the high portion of the chimeric protein to be removed after folding has taken place. Production of the combinant human insulin via an NGH-proinsulin chimeric protein can provide human insulin with correctly linked cysteine bridges with forwer necessary procedural steps, and hence resulting in a higher yield of human insulin. The IMC sequences not only protect insulin sequences from intracclular degradation precursor, facilitate the solubility of the fusion protein and decrease the intermolecular intraactions among the fusion proteins, thus allowing folding of the fused insulin intermolecular intermolecular intermolecular intermolecular commercially useful high concentrations. The procedural steps of cyanogec bronnies cleavage, oxidative supplicitysis and related contentrations. The procedural steps of promitic purification steps can thus be climinated. Appropriate the size of high concentrations of mercaphas or the use or appropriate and celerated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Numan: insulin-like growth factor 1; IGF-1; proinsulin; insulin; multant; insulin-like growth factor binding protein; IGFBP-1; IGFBP-3; antidiabetic: newtoprotective; anorectic; trangilliser; vulnerary; anorectic; cardiant; nephrotropic; dermatchodical; antiHIV; antidi; hyperqlycaemia; obesity; lung disease; alomentulonophritis; intersitial nephritis; Turner's syndrome; Laron's syndrome; short stature; increased fat mass-to-lean ratio; immunological disorder; periphral neuropathy; multiple solerosis; muscular dystrophy; catabolic state; trauma; wounding; intection; HIV; skin disorder; han immunodeficiency virus; diabetes; heart dysfunction;

The present invention describes an itsulin-like growth factor (16F)-1 variant (1), where an amine acid at position 3, 4, 5, 7, 10, 14, 17, 23, 24, 44 or 45, optionally in cumbination with an amino acid at position 12 and/or 16 of the hally cumbin 16F1 sequence, is replaced with an alanine, alycine, or a serine residue. The residue at position 7 may be replaced by any amino acid. (1) can have antidlabetic, cardiant, oneuroprotective, anorectic, tranqualliser, vulnerary, anorectic, cephrotropic, dermatological, antiHIV and antiviral activities. The 16F1 mutants are used in any methods where 16Fs or insulin are used, e.g. in treating hyperdycaemia, obesity-related, neurological, cardiac, renal, immunological, and anabolic disorders. These disorders include lung climents are used in any methods where 16Fs or insulin, are are 16Fs of include lung climents are used in a normal include lung climents of include lung climents and anabolic disorders. These disorders include lung climents of include lung climents and include lung climents of include lung included and include includes and tissue creations. Ridney disorders, and whole body growth disorders. They are an also be used for includers, and dissue events of biological active 16F or insulin a mammal. The 16F-1 mutants improve the native place process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                              The present invention relates to a method for treating cartilage disorders. The method comprises contacting cartilage with an active agent such as insulin-like growth factor (IGF 1) analog with a binding alfinity preference for GF binding protein-3 (IGFBP-3) over IGFBP-1, an IGF-1 analog with a binding affinity preference for IGFBP-1 over IGFBP-3, or a IGFBP displacer peptide that prevents the interaction of IGF with an IGF-B and does not bind to human IGF receptor. The method is useful for treating cartilage disorders (CD), including descentaive CD, urticalar CD such as themstoid arthritis and osteoarthitis. The present sequence is human proinsulin, which was used the illustrate the uncertion

It is used for the construction of PTFp24. The inventors claim a method for protecting bacteria from phage infection - by transformation with cloning vector cong. seqment with restriction and modification activity. Produ. of plasmid pPR 26 or pPR27 which uses pTFp24; and produ. of plasmid pPR29 which uses a synthetic gene coding for the 32 N terminal AAS of proinsulin (see ANN40179).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protecting bacteria from phage infection - by transformation with cloning vector contq. segment with restriction and modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence of the 32 N terminal AAs of proinsulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mormone: cloning vector; phage resistant

The peptide or polypeptide coding sequence codes for 2-20 AAs, esp. AAS50122-PS0125. The functional polypeptide is esp. growth hormone, human insulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      replication and on transcription generating polycistronic mrna

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents human proinsulin and was decoded from the sequences given in AAQ3696-7001. The cDNA fragment ciding for proinsulin was inserted into plasmid vector pUC19 and disested with Kpn1 and HudIII. This resulted in the formation of the vector pPLNS. A fragment encoding amino acids 1-73 of CAI (see AAQ37002) was inserted into ppINS to give a plasmid which contained DNA sequences which coded for amino acids 1-73 of CAI, an 8 amino acid linker sequence and human proinsulin. This plasmid, p.C.CAI-proinsulin, could be used in the formation of insulin analogues which may be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 FVNQHIGGSHLVEALYI,VCGERGFFYTPKTRREAEDI,QVGQVELGGGPGAGSI,QPLALEG

The DNA encoding this sequence was used in the construction of the expression vector of the invention. The coding region of the hpI gene was synthesised and was cloned into the expression plasmid pCZR1265 (see also AAQ38107). Expression of this gene lead to the inclusion of an extra amino acid (Arg) in the second position from the N-terminal of mature hpI. The extra amino acid provides increased expression of levels of the protein and is then cleaved off to avoid undesirable immunological effects when used in humars. (Updated on 25-WAR-2003 to correct PN field.)

"proinsulin chain C"

8..37 /note- "proinsulin chain B"

Location/Qualitiers

```
The proinsulin is expressed in Saccharomyres rerevisiae AB163.1. It is encoded by a synthetic quae (see AAN96279). The 3 consecutive peptides are proinsulin chains B, C and A resp. The regions are
                                                                                                                                                                                                                                                                                                                                                         Expression and secretion of heterologous proteins in yeast - using truncated a-factor leader sequence confq. signal peptide and glycosylation site.
